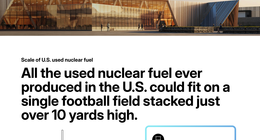
OKLO

Oklo is recycling used nuclear fuel.

Turning a national liability into an energy asset



Scale of U.S. used nuclear fuel

All the used nuclear fuel ever produced in the U.S. could fit on a single football field stacked just over 10 yards high.

There are almost 100,000 metric tons of U.S. used nuclear fuel stored in silos around the country, according to an EIA analysis, that's the energy equivalent of

1.2 trillion barrels of oil

Why volumes of used nuclear fuel are small

Uranium is one of the most energy-dense materials on Earth.

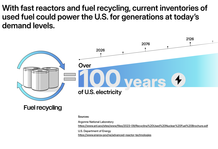
A uranium pellet about the size of a golf ball can supply the lifetime power needs of an average person.

A small amount of uranium produces an enormous amount of power, which is why nuclear waste volumes remain limited.

The once-through fuel limitation

Most of the energy in nuclear fuel is never used.

In traditional light water reactors (LWRs) today, fuel is removed after a single use even though 95% of its energy remains.



This is like refilling the car with gas every five miles.

Nuclear management and disposal practices are highly regulated and safe.

Low-level waste, which includes everyday materials from medicine, research, and industry, has proven disposal pathways at licensed facilities across the United States.

Examples

Radioactivity can range from just above natural background levels to higher levels in specific cases — all handled under established and rigorous safety standards.

https://www.nrc.gov/waste/low-level-waste.html

Key fact

Low-level radioactive waste is compacted and disposed of safely in near-surface disposal facilities that operate today.

The opportunity in existing used fuel

America's used nuclear fuel is a long-term energy resource.

With fast reactors and fuel recycling, current inventories of used fuel could power the U.S. for generations at today's demand levels.

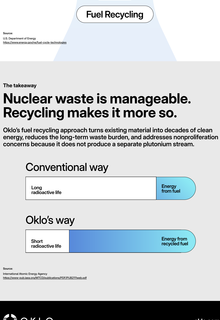
How Oklo changes the fuel cycle

Oklo recovers energy instead of discarding it.

By recycling used nuclear fuel, Oklo extends the productive life of fuel and reduces the amount of waste that must be stored and managed.



Waste volume comparison

Recycling dramatically reduces the amount of material requiring long-term disposal.

Oklo's fuel recycling

Fuel recycling reduces the volume of what's currently stored as long-term waste by converting most of it into new fuel for the last-Nation power plants like the Aurora powerhouse.

Waste management timeframe

Recycling reduces the radioactivity of nuclear waste from 100,000+ years to less than 300 years.

By reusing the long-lived portions of used nuclear fuel, recycling leaves a much smaller final waste stream and reduces the long-term burden of waste management.

Key comparison:

From hundreds of thousands of years to hundreds of years before reaching background radiation levels.

A fundamentally different outcome

Fuel security and waste reduction are part of the same solution.

Recycling turns used fuel into a domestic energy resource for advanced reactors, strengthening energy security and reducing a long-term waste burden.

The takeaway

Nuclear waste is manageable. Recycling makes it more so.

Oklo's fuel recycling approach turns existing material into decades of clean energy, reduces the long-term waste burden, and addresses nonproliferation concerns because it does not produce a separate plutonium stream.
